Overview

- Goal
 - Estimate total uncertainty in calculated dose results based on assumed uncertainties in element response
 - *i.e. - propagate uncertainties through algorithm for a particular dose result*
- Method
 - Estimate element uncertainties
 - Generate sample of “random” responses
 - Process sample through PC algorithm
 - Calculate statistics on resulting distribution of calculated doses

Uncertainty in TL Dosimetry

- Identify sources
- Measure or estimate individual uncertainties
- Calculate combined uncertainty in element responses
- Calculate total propagated uncertainty in final dose result

Sources of Uncertainty

- Example – Panasonic UD-802

Source	A/B	Source	Distribution	Method of est.	Range	Value
Random uncertainty in TLD reading	A	data	Normal	Model u vs. reading	N/A	
Reader calibration	B	procedure	Normal	3% sd	± 9%	reading*.03
Reader linearity	B	Panasonic	Rectangular	[Max. range/2]/√3	± 10% of reading	reading*.058
TL Fade <i>accuracy of correction</i>	B	test	Rectangular	[Max. range/2]/√3	-2% to +7% of reading	reading*.026

Distribution type and estimate of standard uncertainty based on guidance in GUM (or NIST 1297)

Total Propagated Uncertainty

What about the algorithm?

How do we determine the impact of element uncertainties on the final dose?

Option 1 - Law of propagation of uncertainty (GUM and NIST TN1287)

$$u_c^2(y) = \sum_{i=1}^N \left(\frac{\partial f}{\partial x_i} \right)^2 u^2(x_i) + 2 \sum_{i=1}^{N-1} \sum_{j=i+1}^N \frac{\partial f}{\partial x_i} \frac{\partial f}{\partial x_j} u(x_i, x_j). \quad (\text{A-3})$$

Pros – Real-time calculation. Results generated for all calculated doses.

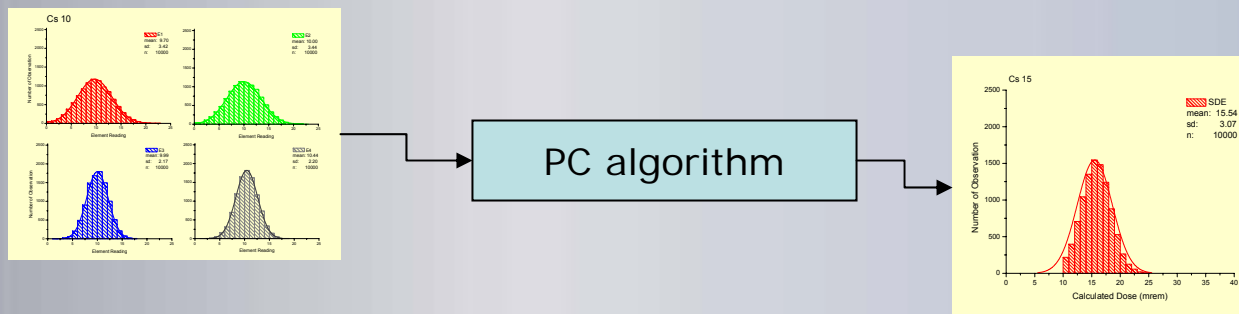

Cons – Difficult with complicated algorithms, complications with covariance term. What about decision points?

Total Propagated Uncertainty

What about the algorithm?

Option 2 - Generate sample of results and process through algorithm and analyze resultant distribution (GUM Supplement 1)

Pros – Result is as good as the input. Can be generated for any algorithm.

Cons – Must be run for each dose and field condition.

Process Overview

Identify sources of uncertainty in element readings

Calculate total combined uncertainty in element readings

Generate file of input responses (GUM Suppl. 1)

Process using PC algorithm

Analyze output distribution of doses

PC algorithm

GUM Supplement 1

Appendix C

Generate “random” samples from assumed distribution using Box-Muller Gaussian pseudo-random number generator.

1. *Generate rectangular random variates between 0 and 1. Excel function RAND()*
2. *Calculate two “draws”, Z_1 and Z_2 , from Gaussian variable with mean=0, sd = 1*
3. *Apply to assumed distribution by:*
$$X = \mu + \sigma \cdot Z$$

Input parameters	
None	
Output parameters	
Z_1, Z_2	Two draws from a Gaussian variable with zero expectation and unit standard deviation
Computation	
a) Generate rectangular random variates V_1 and V_2 between zero and one	
b) Form $Z_1 = \sqrt{-2 \log V_1} \cos 2\pi V_2$ and $Z_2 = \sqrt{-2 \log V_1} \sin 2\pi V_2$	
c) Take Z_1 and Z_2 as <i>two</i> standard Gaussian variates	

Table C.3 — The Box-Muller Gaussian pseudo-random number generator.

Generated Input Distributions

Simple example – Panasonic 802

100 mrem ^{137}Cs
+ 30 mrem bkgd (Cs)

Calculated statistics for *net responses*:

	E1	E2	E3	E4
μ	97	100	100	100
σ	8.99	9.22	8.67	8.67

Generated Input Distributions

Simple example - continued

Element Responses: Cs 100 + 30 bkgd n= 100000

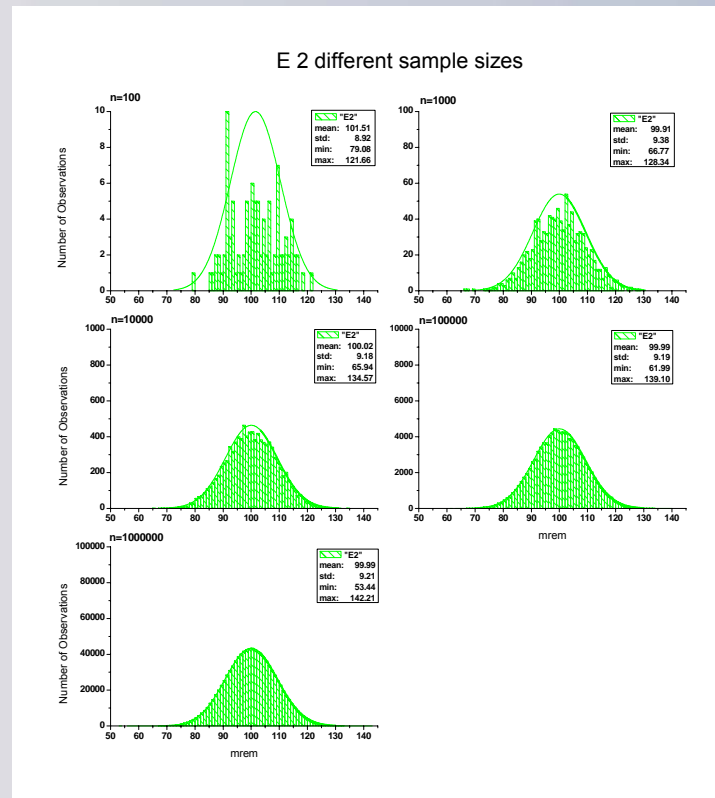

Generated Input Distributions

Simple example - continued Effect of sample size

E2 response for
100 mrem ^{137}Cs
with 30 mrem
background

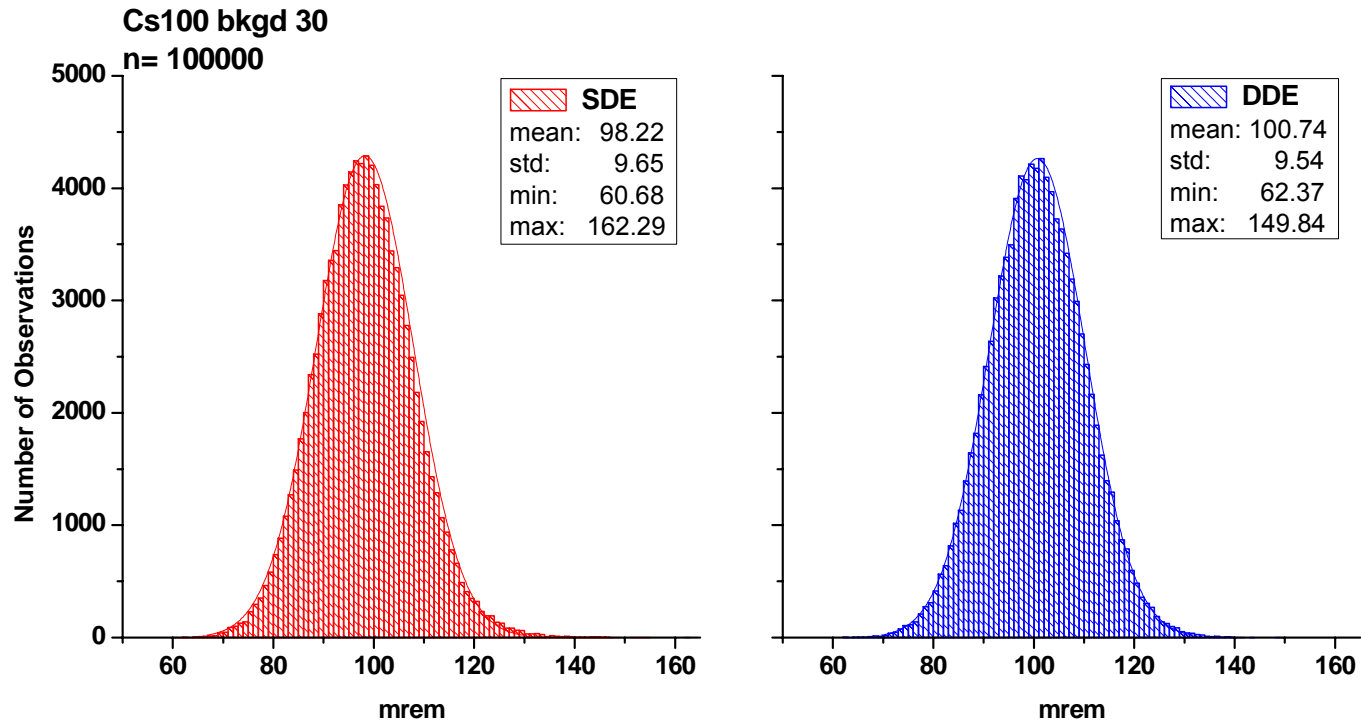

Calculated	9.22
N=100	8.92
N=1000	9.38
N=10000	9.18
N=100000	9.20
N=1000000	9.22

Time to generate 100k sample: < 10 sec

Output file

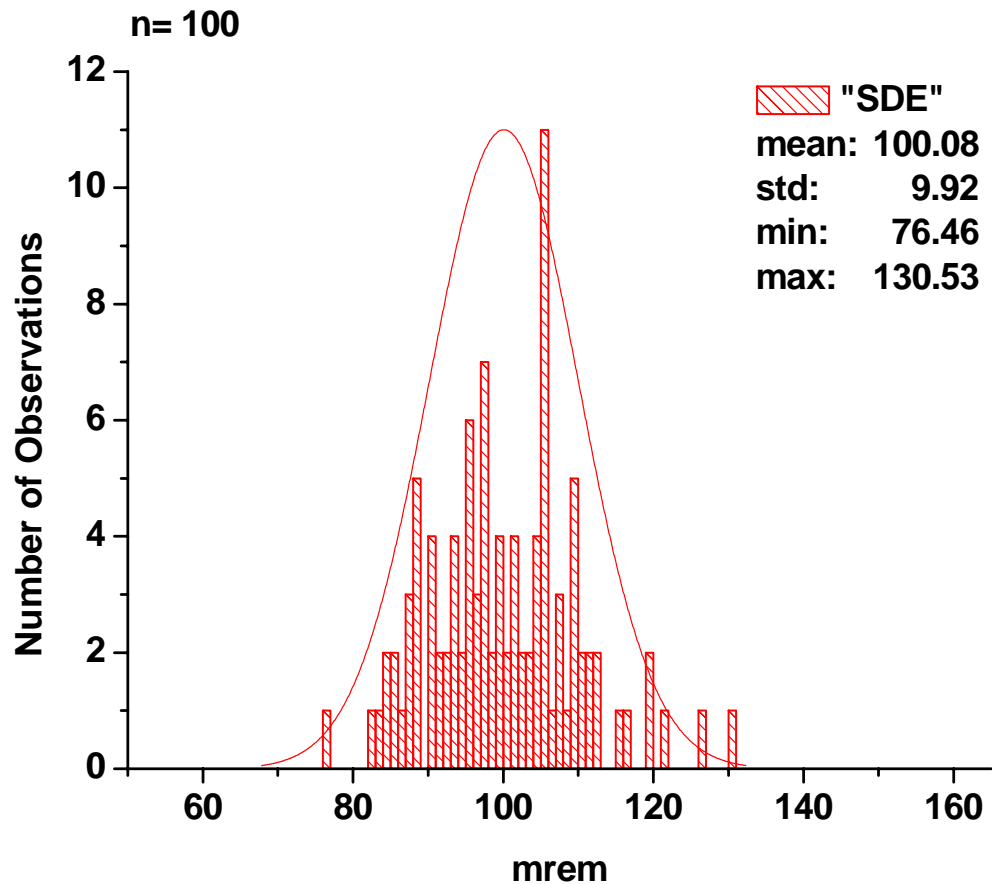

Time to process 100k output: < 20 min; 1M < 2 hrs

Effect of n on output distribution

100 mrem ^{137}Cs , 30 mrem bkgd

Effect of n on output distribution

100 mrem ^{137}Cs , 30 mrem bkgd

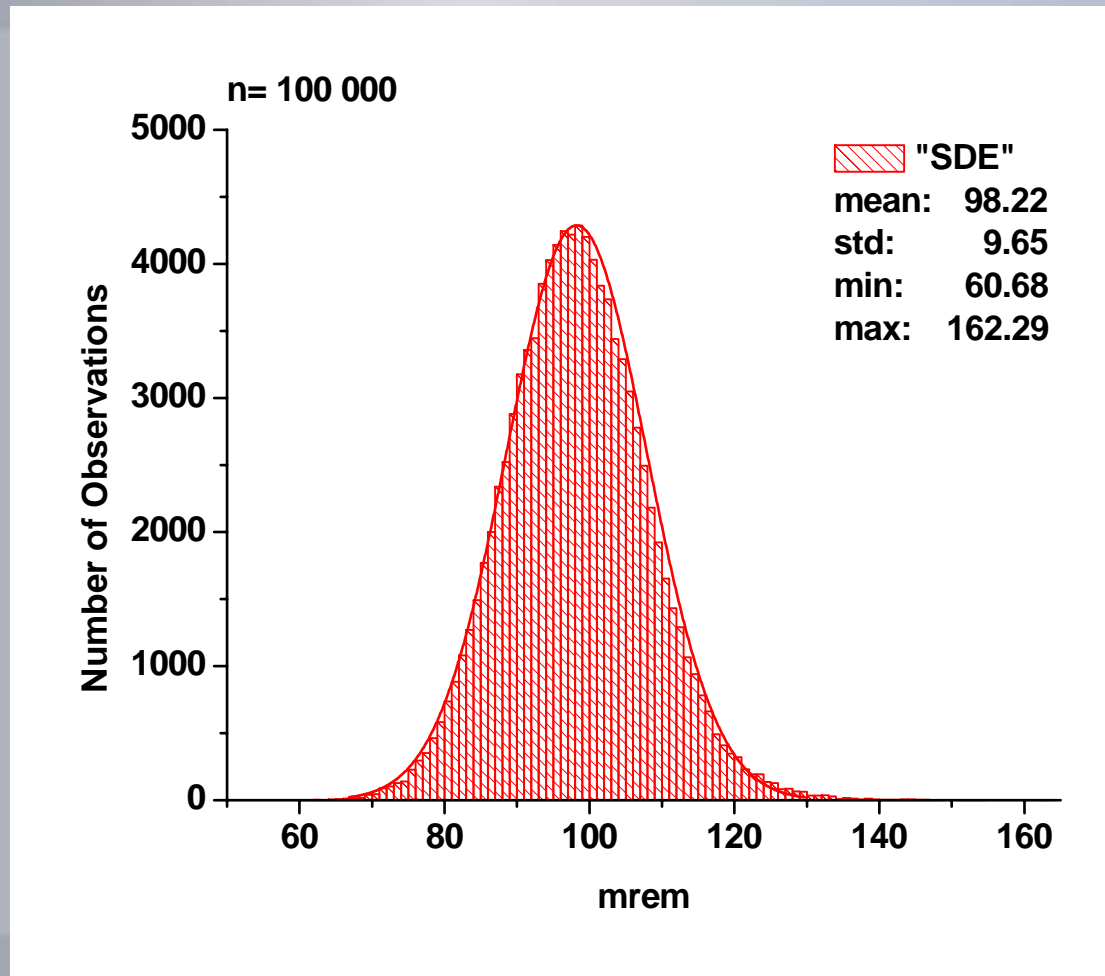

Effect of n on output distribution

100 mrem ^{137}Cs , 30 mrem bkgd

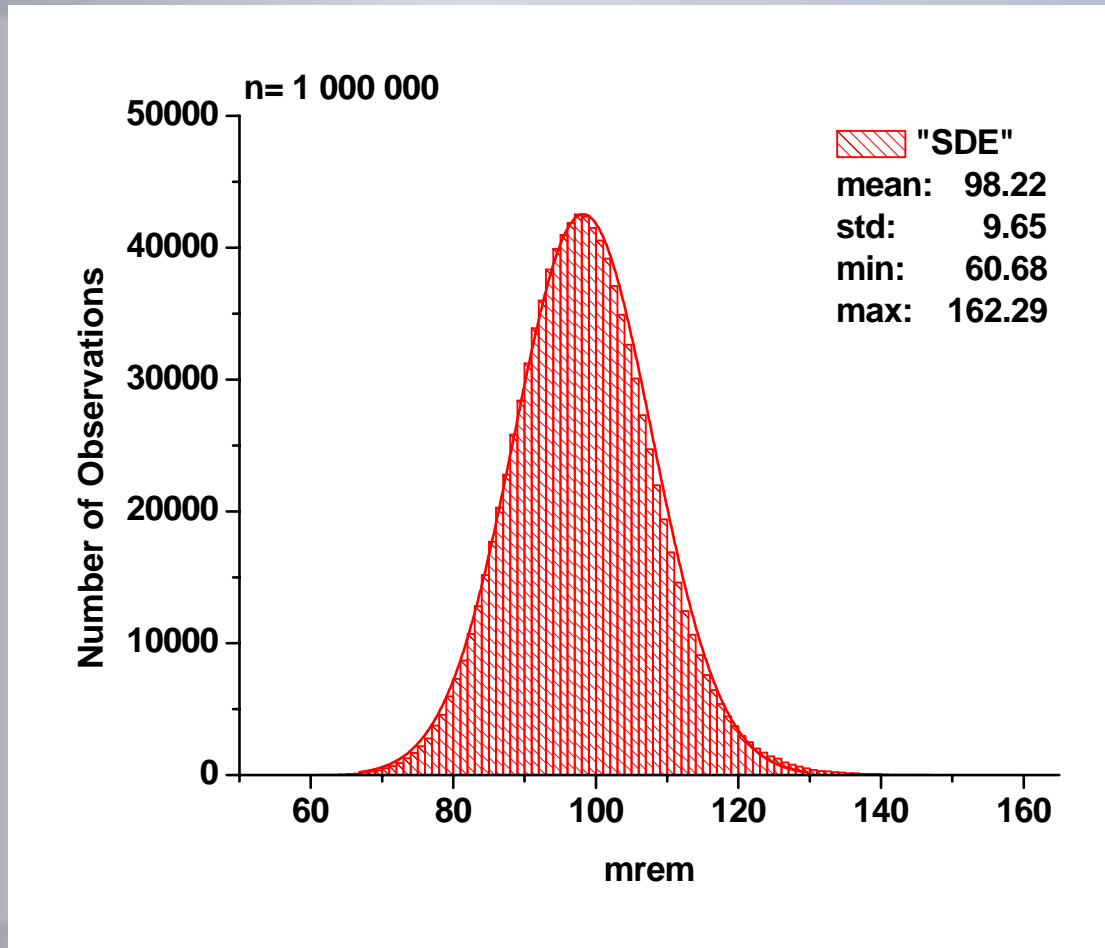

Effect of n on output distribution

100 mrem ^{137}Cs , 30 mrem bkgd

Effect of n on output distribution

100 mrem ^{137}Cs , 30 mrem bkgd

Application

- Uncertainty vs dose
- Algorithm test points
- Mixture performance

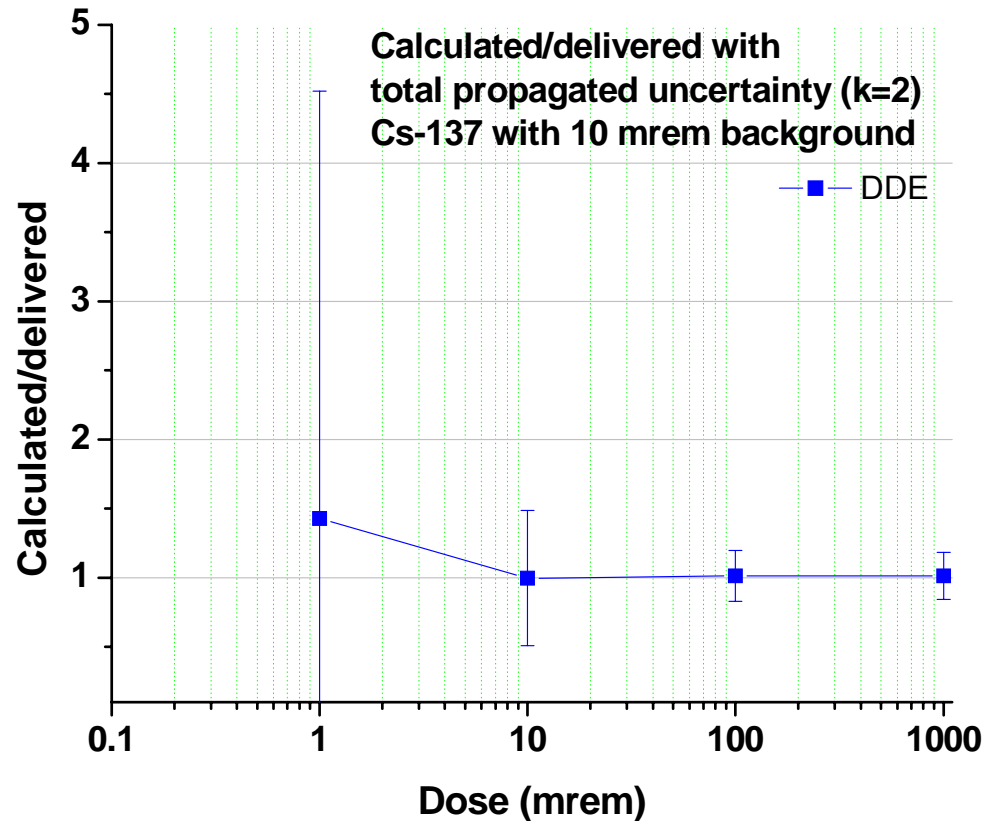

Uncertainty vs. dose

^{137}Cs with 10 mrem bkgd

Results of four different runs with doses of 1, 10, 100, and 1000 mrem ^{137}Cs .

Two standard deviation error bars (coverage factor = 2)

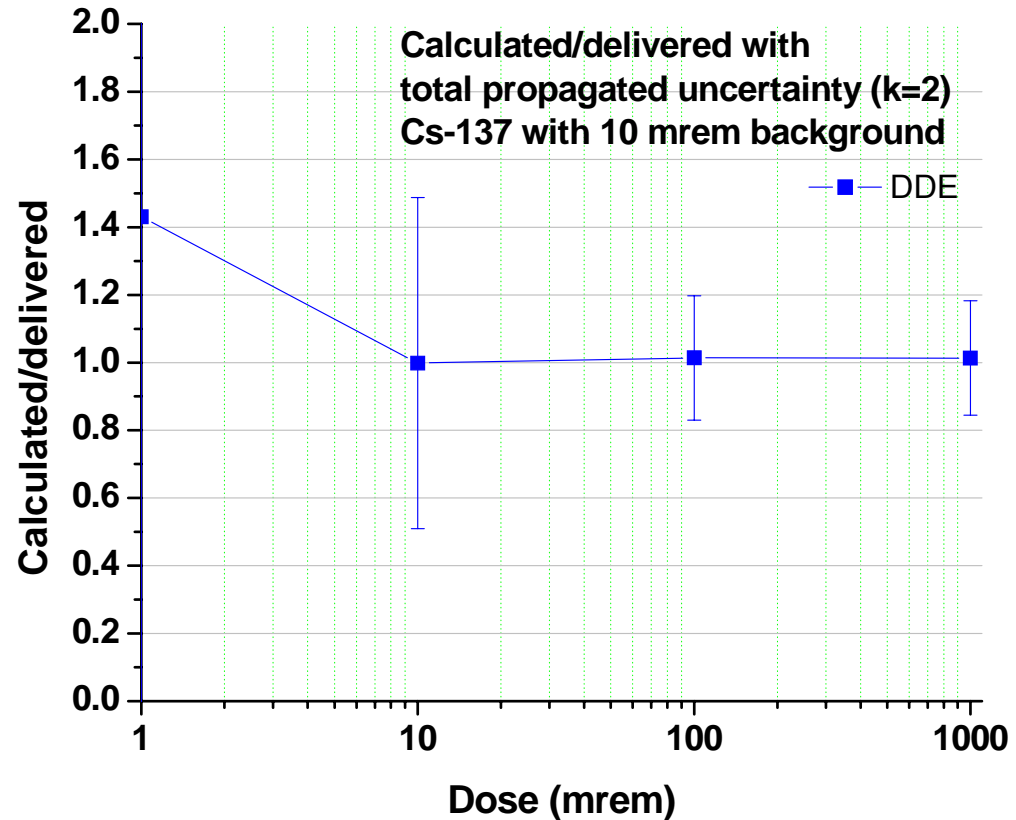

Uncertainty vs. dose

^{137}Cs with 10 mrem bkgd - detail

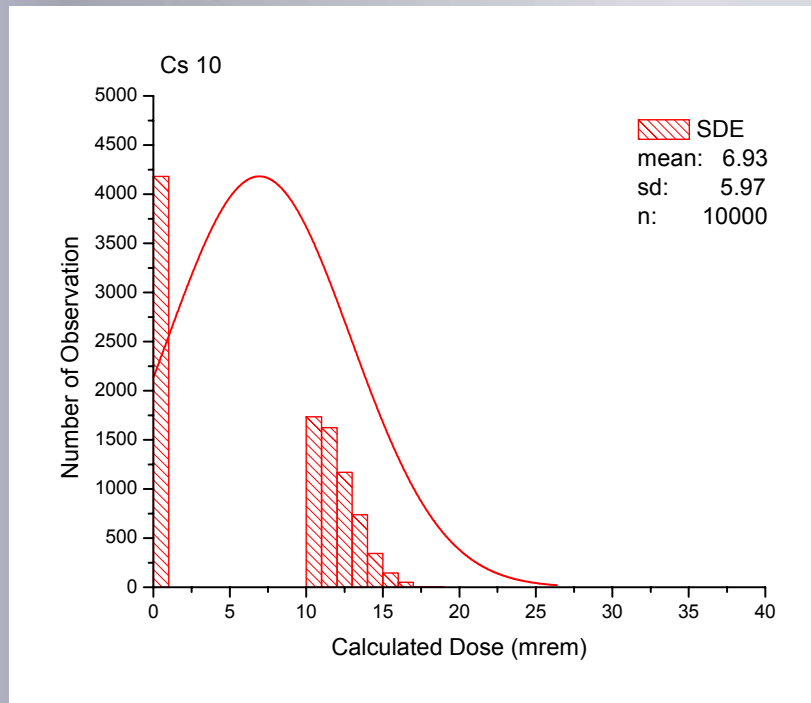

Results of four different runs with doses of 1, 10, 100, and 1000 mrem ^{137}Cs .

Two standard deviation error bars (coverage factor = 2)

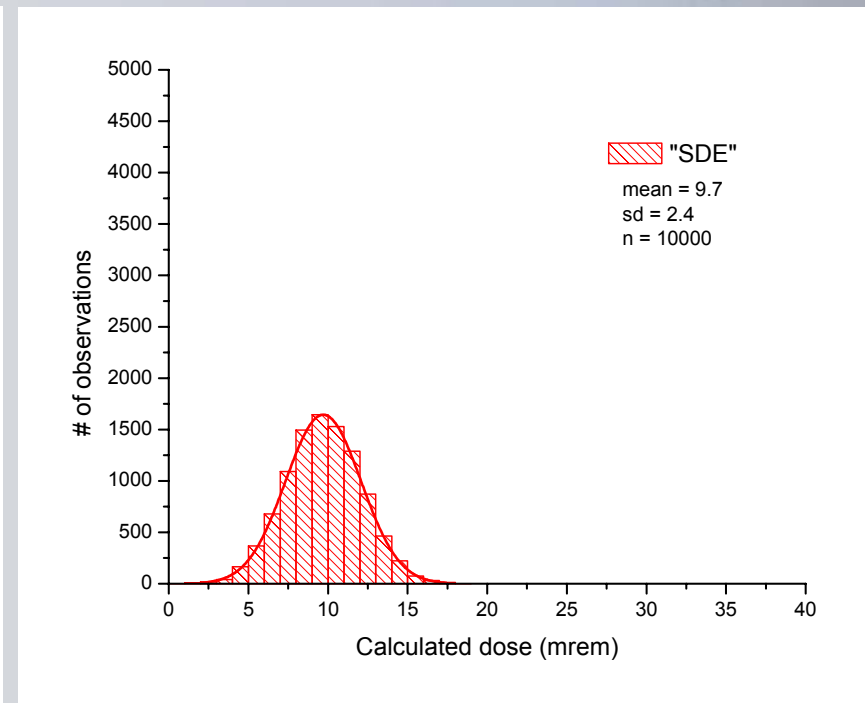

Algorithm Decision Points

Minimum reportable = 10

Minimum reportable = 0

Mixture Performance

30 mrem ^{137}Cs + 100 mrem ^{204}Tl (10 bkgd)

Expected responses:
